RNA-Seq Analysis: Get the Data

Create new history

 (cog) → Create New

Import:

Shared Data → Data Libraries → Training → RNA-Seq*

→ Raw Reads

→ Select all

→ Reference

→ Select all

 **UC DAVIS** Bioinformatics Core
Genome Center

* RNA-Seq example datasets from the 2013 UC Davis Bioinformatics Short Course. <http://bit.ly/ucdbsc2013>

NGS Quality Control *Revisted*

Do QC, or rely on bad data not to map?

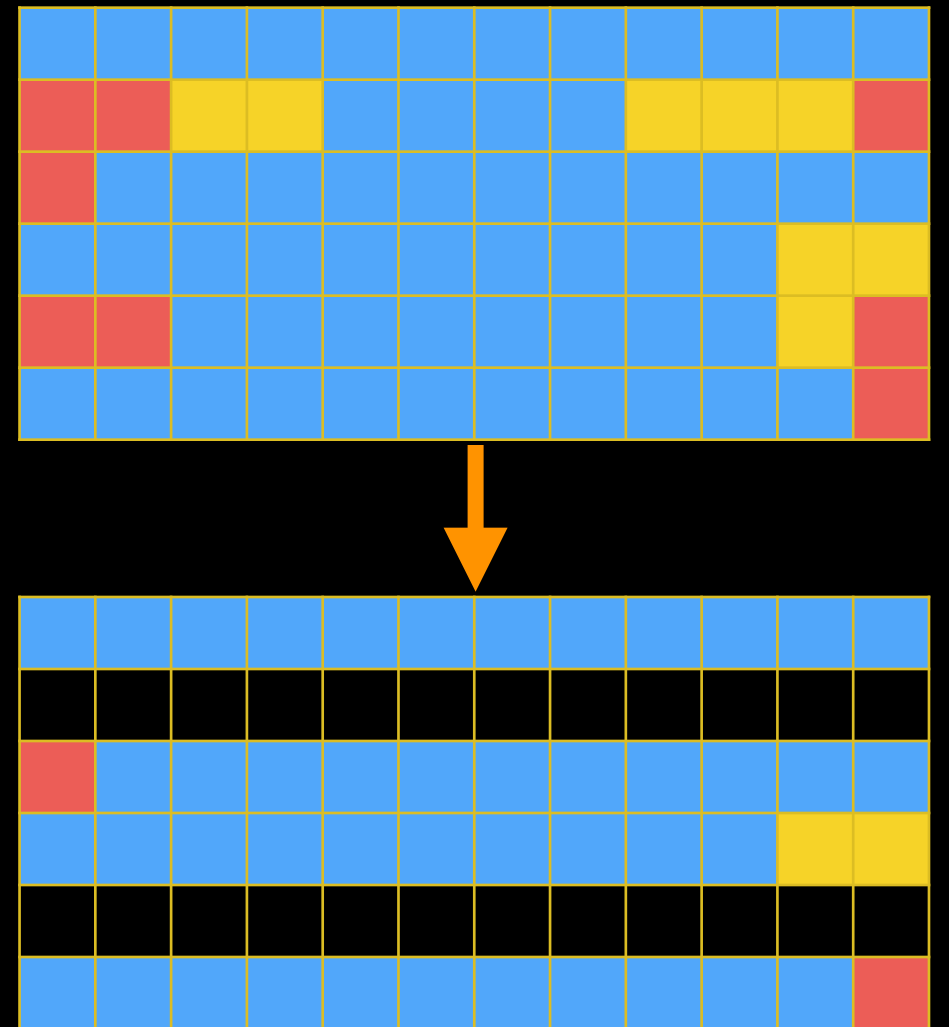

NGS Data Quality: Assessment tools

Same tools available as yesterday:

**FastQC, Sliding window, Trimmer by Column, by
quality score and length**

NGS Data Quality: Base Quality Trimming

- ~~Trim~~ Filter as we see fit: Option 2
 - NGS QC and Manipulation → **Filter FASTQ reads by quality score and length**
 - **Keep or discard whole reads**
 - Can have different thresholds for different regions of the reads.
 - **Keeps original read length.**

NGS Data Quality: Base Quality Trimming

- Trim as we see fit: Option 3
 - NGS QC and Manipulation → **FASTQ Quality Trimmer by sliding window**
 - Trim from both ends, using sliding windows, until you hit a high-quality section.
 - **Produces variable length reads**

Trim? *As we see fit?*

- 3 options
 - One **preserves original read length**, two don't
 - One **preserves number of reads**, two don't
 - Two **keep/make every read the same length**, one does not
 - One **preserves pairings**, two don't

Keeping paired ends paired: Things to Try

- Don't bother.
- Run a workflow (try the "Re-Pair Paired ends after QC may have broken them" workflow on usegalaxy.org) that removes any unpaired reads before mapping:
- Run the Picard **Paired Read Mate Fixer** after mapping reads.

RNA-Seq Analysis: Restore Pairings

If your QC filters might have broken pairings, then you may want to restore them.

Shared Data → Published Workflows

→ Re-Pair Paired ends after QC may have broken them

→ Import

Workflows

→ Re-Pair Paired ends after QC may have broken them

→ Run

Re-Pair Paired ends after QC may have broken them

Workflow takes 4 inputs

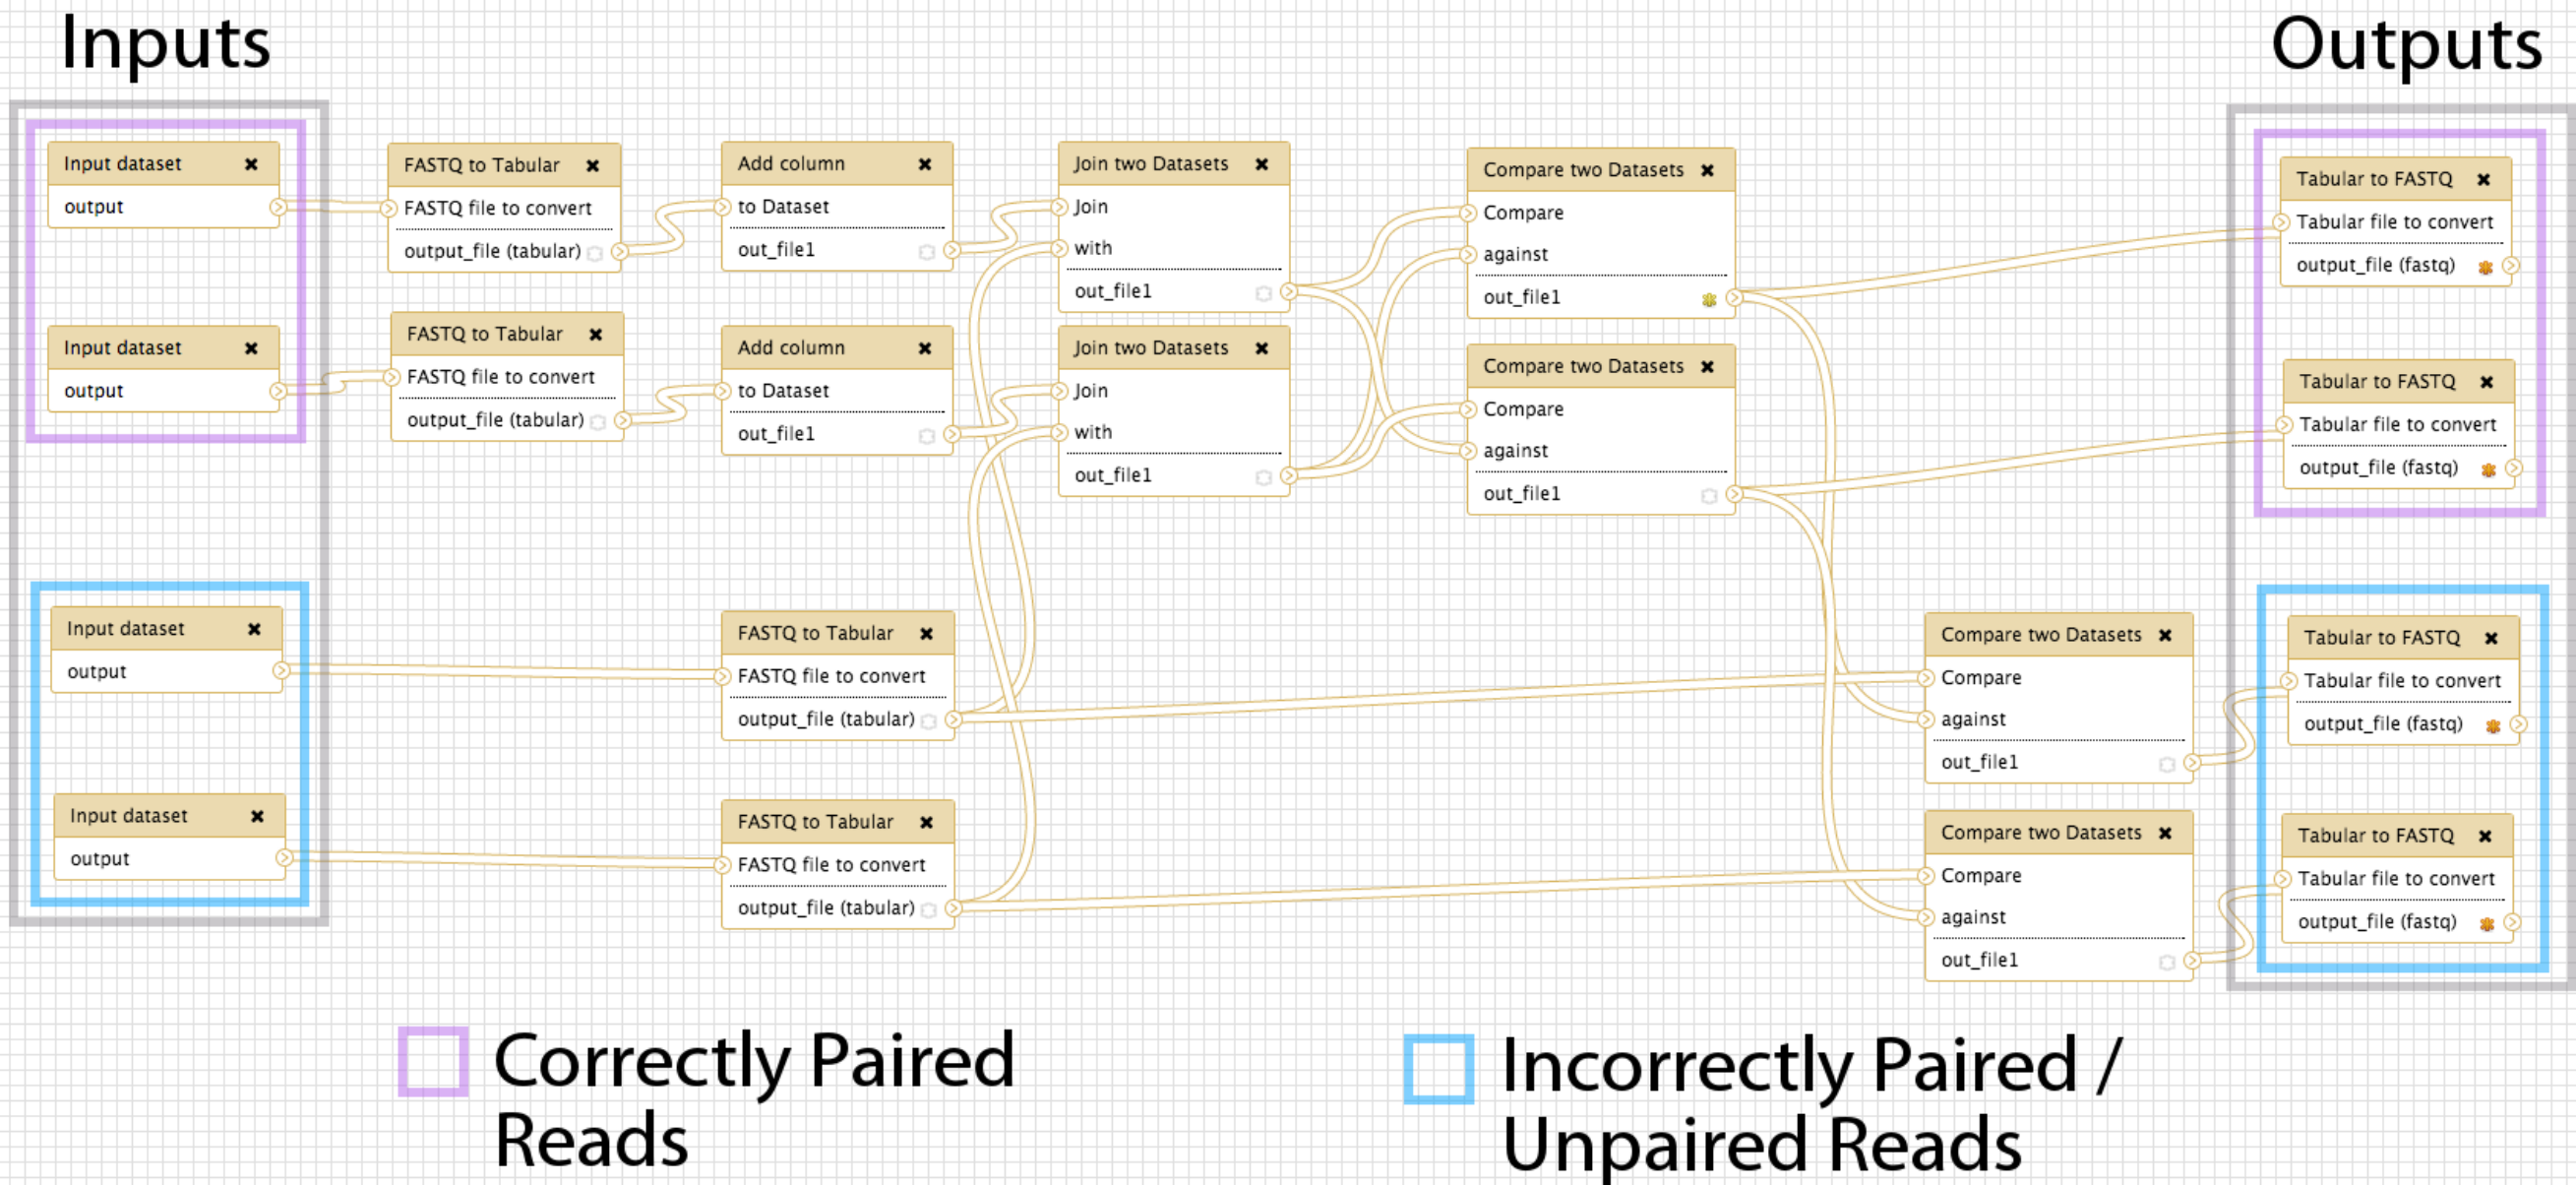

- Forward Reads, before QC
- Reverse Reads, before QC
- Forward Reads, after QC
- Reverse Reads, after QC

And produces 4 outputs

- Forward reads, re-paired
- Reverse reads, re-paired
- Forward reads, singletons
- Reverse reads, singletons

Workflow assumes pre-QC reads are correctly paired

Re-Pair Paired ends after QC may have broken them

NGS Data Quality: Sequencing **Artifacts**

Repeat this process with MeOH Rep1 R2 (the reverse reads)

... and now we notice a problem in Overrepresented sequences:

 **Overrepresented sequences**

Sequence	Count	Percentage	Possible Source
CTGTGTATTTGTCAATTTTCTTCTCCACGTTCTTCTCGGCCTGTTTCCGTAGCCT	590	0.3541692929220167	No Hit
TT	342	0.2052981325073385	No Hit
CGGCCACAAATAAACACAGAAATAGTCCAGAAATGTCACAGGTCCAGGGCAGAGGA	325	0.19509325457568719	No Hit
CTGCATTATAAAAAGGACAGCCAGATATCAACTGTTACAGAAATGAAATAAGACG	230	0.13806599554587093	No Hit
CGGCCGCAAATAAACACAGAAATAGTCCAGAAATGTCACAGGTCCAGGGCAGAGGA	199	0.11945710049403614	No Hit
GTCAGCTCAACTTGTAGGCCCCAAAAGAAAACAGCGTCTTACTGGGGAGGGATAT	197	0.11825652661972422	No Hit

NGS QC and Manipulation → **Remove sequencing artifacts**

But this will break pairings (if we still have them).

Or, can rely on mapper to just not map them.

RNA-seq Exercise: Mapping with Tophat2

- Tophat looks for best place(s) to map reads, and best places to insert introns
- *Imagine pages and pages of discussion on the intricacies and pitfalls of RNA-seq mapping here.*

Mapping with Tophat: **mean inner distance**

Expected distance between paired end reads

- Determined by sample prep
- We'll use **90*** for **mean inner distance**
- We'll use **50** for **standard deviation**

* The library was constructed with the typical Illumina TruSeq protocol, which is supposed to have an average insert size of 200 bases. Our reads are 55 bases (R1) plus 55 bases (R2). So, the Inner Distance is estimated to be $200 - 55 - 55 = 90$

From the 2013 UC Davis Bioinformatics Short Course

Mapping with Tophat: Use Existing Annotations?

You can bias Tophat towards known annotations

- Use Own Junctions → Yes
 - Use Gene Annotation → Yes
 - Gene Model Annotation → genes_chr12.gtf
- Use Raw Junctions → Yes (tab delimited file)
- Only look for supplied junctions → Yes

Mapping with Tophat: **Make it quicker?**

Warning: Here be dragons!

- **Allow indel search** → **No**
- **Use Coverage Search** → **No** (wee dragons)

TopHat generates its database of possible splice junctions from two sources of evidence. The first and strongest source of evidence for a splice junction is when two segments from the same read (for reads of at least 45bp) are mapped at a certain distance on the same genomic sequence or when an internal segment fails to map - again suggesting that such reads are spanning multiple exons. With this approach, "GT-AG", "GC-AG" and "AT-AC" introns will be found *ab initio*. The second source is pairings of "coverage islands", which are distinct regions of piled up reads in the initial mapping. Neighboring islands are often spliced together in the transcriptome, so TopHat looks for ways to join these with an intron. **We only suggest users use this second option (--coverage-search) for short reads (< 45bp) and with a small number of reads (<= 10 million).** This latter option will only report alignments across "GT-AG" introns

Mapping with Tophat: **Max # of Alignments Allowed**

Some reads align to more than one place equally well.

For such reads, how many should Tophat include?

If more than the specified number, Tophat will pick those with the best mapping score.

Tophat **breaks ties randomly**.

Tophat assigns equal fractional credit to all n mappings

Instructs TopHat to allow up to this many alignments to the reference for a given read, and choose the alignments based on their alignment scores if there are more than this number. The default is 20 for read mapping. Unless you use `--report-secondary-alignments`, TopHat will report the alignments with the best alignment score. **If there are more alignments with the same score than this number, TopHat will randomly report only this many alignments.** In case of using `--report-secondary-alignments`, TopHat will try to report alignments up to this option value, and TopHat may randomly output some of the alignments with the same score to meet this number.

Mapping With Tophat: Cleanup

Use only the good stuff!

NGS BAM Tools → Filter

Mapping Quality → ≥ 20

Insert Filter → `isProperPair: Yes`

Insert Filter → `reference: chr12`

RNA-Seq Mapping With Tophat: Resources

RNA-Seq Analysis: Transcript Prediction

Import:

Shared Data → Data Libraries → Training → RNA-Seq*
→ Mapped Filtered Reads
→ Select all

* RNA-Seq example datasets from the 2013 UC Davis Bioinformatics Short Course. <http://bit.ly/ucdbsc2013>

RNA-Seq Analysis: Transcript Prediction

Run StringTie

NGS RNA Analysis → StringTie

Use GFF to guide? → No

Use defaults

RNA-Seq Analysis: Transcript Prediction

Run Cuffmerge

NGS RNA Analysis → Cuffmerge

Use reference Annotation? → Yes

Use sequence data? → Yes

Source for reference List → History, chr12.fa

Cuffdiff

- Part of the Tuxedo RNA-Seq Suite (as are Tophat, Bowtie, StringTie, Cufflinks, Cuffmerge, ...)
- Identifies differential expression between multiple datasets
- Widely used and widely installed on Galaxy

NGS: RNA Analysis → Cuffdiff

Cuffdiff

Cuffdiff previously used **FPKM/RPKM** as central statistic.

Total # mapped reads heavily influences FPKM/RPKM.

Can lead to challenges when you have very highly expressed genes in the mix.

Cuffdiff

- Which Transcript definitions to use?
 - Official (`genes_chr12.gtf` in our case)
 - MeOH or R3G **Cufflinks** transcripts
 - Results of **Cuffmerge** on MeOH & R3G **Cufflinks** transcripts
- Depends on what you care about
 - I'll use **Cuffmerge** on MeOH & R3G **Cufflinks** transcripts

Cuffdiff

- Running with 2 Groups: MeOH and R3G
- Each group has 3 replicates each

Cuffdiff

Produces many output files, all explained in doc

We'll focus on gene differential expression testing

Cuffdiff: differentially expressed genes

Column	Contents
test_stat	value of the test statistic used to compute significance of the observed change in FPKM
p_value	Uncorrected P value for test statistic
q_value	FDR-adjusted p-value for the test statistic
status	Was there enough data to run the test?
significant	and, was the gene differentially expressed?

Cuffdiff

- Column 7 (“status”) can be FAIL, NOTEST, LOWDATA or OK
 - Filter and Sort → **Filter**
 - **c7 == 'OK'**
- Column 14 (“significant”) can be yes or no
 - Filter and Sort → **Filter**
 - **c14 == 'yes'**

Returns the list of genes with

- 1) **enough data to make a call**, and
- 2) **that are called as differentially expressed.**

Cuffdiff: Next Steps

Try running Cuffdiff with different **normalization** and **dispersion estimation** methods.

Compare the differentially expressed gene lists.
Which settings have what type of impacts on the results?

Are there any patterns to the identified genes?

Galaxy is available ...

<http://aws.amazon.com/education>

<http://globus.org/>

<http://wiki.galaxyproject.org/Cloud>

AWS in Education Grants Program

<http://aws.amazon.com/education>

What is our path?

Today we will:

- Launch our own Galaxy server on AWS
- Make the server dynamically scalable in response to demand.
- Run some basic analysis on it.
- Make it go away.

Full Disclosure

To use *AWS* you must **create an *AWS* account with a credit card associated with it.**

You must also have created a key pair.

We will use the IAM account for this workshop.

IAM Accounts

Imagine, a link to a list of accounts, and
credentials, here.

Initializing 'Galaxy' cluster type. Please wait... (2014-01-15 06:48:34)

Welcome to [CloudMan](#). This application allows you to manage this cloud cluster and the services provided within. If this is your first time running this cluster, you will need to select an initial data volume size. Once the data store is configured, default services will start and you will be able to add and remove additional services as well as 'worker' nodes on which jobs are run.

[Cluster status log](#) +

Cloud Launched

The screenshot shows the Amazon CloudWatch console interface for a newly launched Galaxy cluster. At the top, a yellow message box contains two status updates: "Initializing 'Galaxy' cluster type. Please wait... (2014-01-15 06:48:34)" and "All cluster services started; the cluster is ready for use. (2014-01-15 06:53:24)". Below the messages, a paragraph explains that on first-time runs, users must select an initial data volume size, after which default services start and additional services or worker nodes can be added. A row of four buttons is provided: "Terminate cluster", "Add nodes" (with a dropdown arrow), "Remove nodes", and "Access Galaxy".

Status

Cluster name: PAG_CLOUD_2

Disk status: 3.2G / 10G (32%)

Worker status: Idle: 0 Available: 0 Requested: 0

Service status: Applications Data

Autoscaling is **off**. Turn on?

Cluster status log

The interface also features a 4x4 grid of node status icons. The top-left icon is green with a server symbol, while the other 15 icons are grey, indicating that no worker nodes are currently active or requested.

Cool things to do

- Create a **login**
- Become an **admin**
- Set up **autoscaling**
- Run ~ **Galaxy 101**
 - <http://usegalaxy.org/galaxy101>
- **Shut it down**

Agenda: Day 2

- 9:00 Welcome
- 9:15 RNA-Seq Example Part 1
- 10:30 Break
- 10:45 RNA-Seq Example Part 2
- 12:00 Lunch (on your own)
- 13:00 SNP & Variant Calling Part 1
- 15:30 Break
- 15:45 SNP & Variant Calling Part 2
- 16:15 Galaxy on the Cloud
- 17:00 Done (Almost)**

ChIP-Seq Analysis: Replicates

Shared Data → Data Libraries → Training → ChIP-Seq →

MACS Outputs → Peaks in BED format

Import files for

Nanog Rep 2

Pou5f1 Rep 1

Pou5f1 Rep 2

ChIP-Seq Analysis: Unify Replicates

Operate on Genomic Intervals → Concatenate

Concatenate Nanog Rep 1 and 2 peak files

Operate on Genomic Intervals → Cluster

Use default parameters

Rename the output dataset

Add the **Nanog cluster** output to your visualization

ChIP-Seq Analysis: Unify Replicates

Repeat for **Pou5f1** replicates

Operate on Genomic Intervals → Concatenate

Concatenate Pou5f1 Rep 1 and 2 Peak files

Operate on Genomic Intervals → Cluster

Use default parameters

Rename the output dataset

Add the **Pou5f1 cluster** output to your visualization

ChIP-Seq Analysis: Differential binding

Operate on Genomic Intervals → Subtract

First dataset clustered → Pou5f1

Second dataset clustered → Nanog

Return → Intervals with no overlap
